Scanned pages are pictures of text, not text.
A viewer has to shrink a 300 dpi scan by about three to show it
at 100%, and keeping one sample in three drops most of the thin
strokes of its letters. Averaging the samples each screen pixel
covers keeps them, as Acrobat, Chrome and Preview show scans.

Zoomed in, the same scan is enlarged instead: each sample becomes
a block unless it is smoothed. Page-size images are smoothed;
icons, QR codes and pixel art keep their hard pixels.

Nothing on such a page can be selected or found until its words
are recognized. PdfCraft now recognizes them in the background,
page by page, without changing the file.
